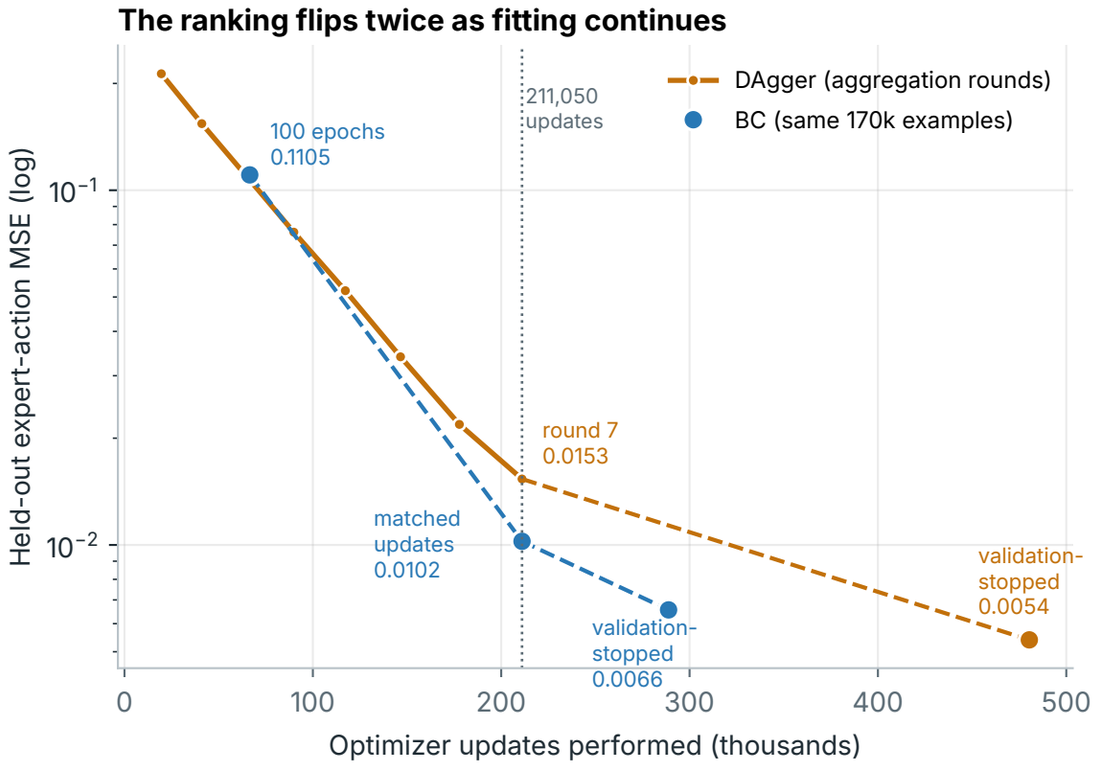
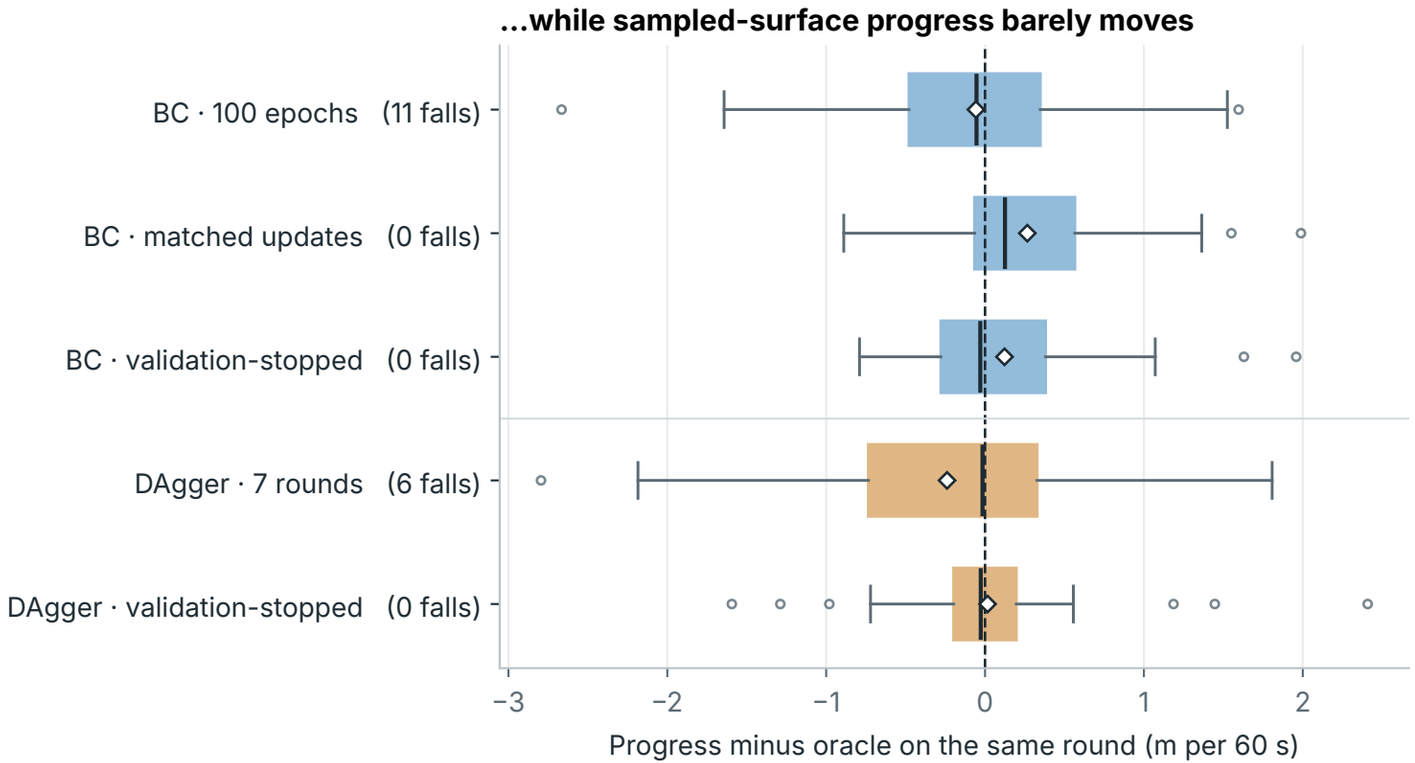
Original scene, one training lineage: imitation error depends on how much fitting each method receives





Left: held-out MSE on the 16 native gait actions. DAgger points are the saved aggregation rounds; dashed segments are further fitting on the fixed final data. "Validation-stopped": improvement below 1e-5 for 25 epochs on the shared validation pool, not proven convergence. Right: 30 sampled surface/task rounds, box = IQR, ◇ = mean, whiskers = 1.5 × IQR; falls over 30 active minutes.
