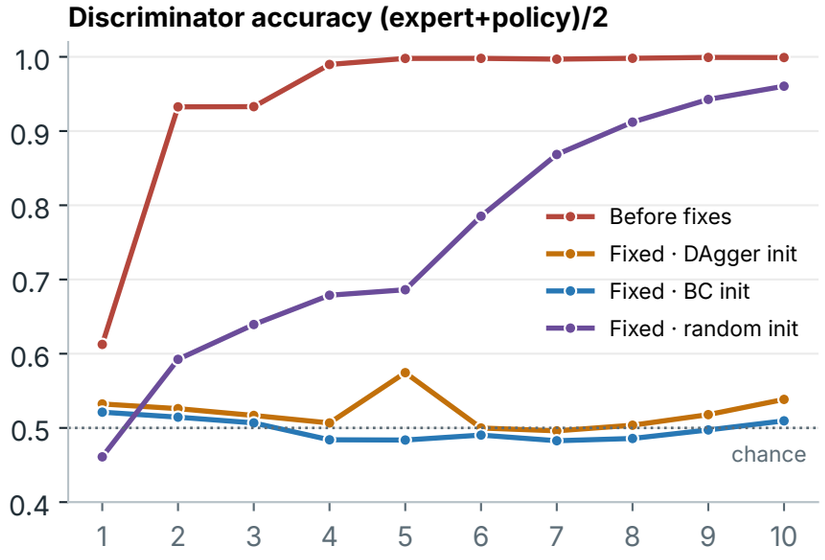
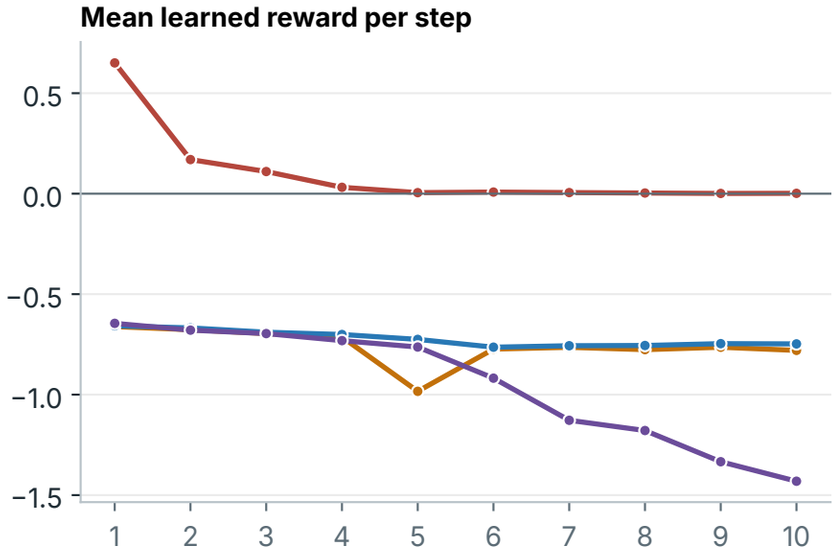
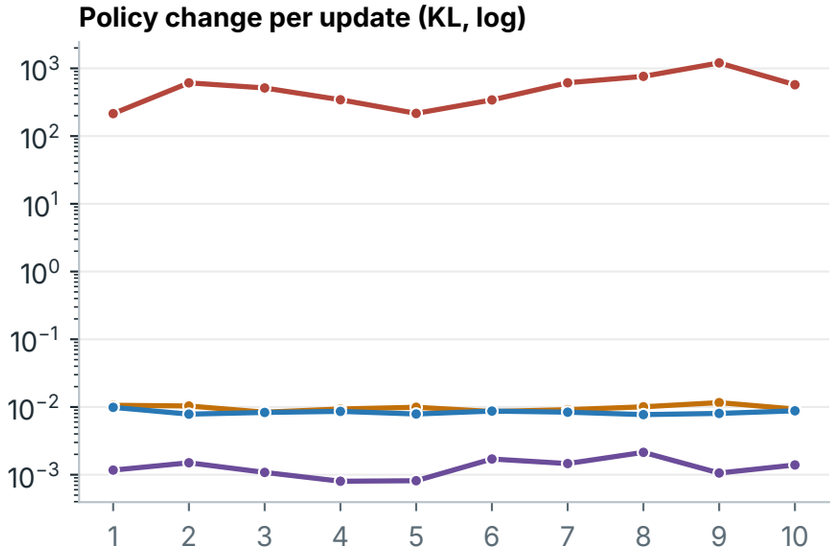
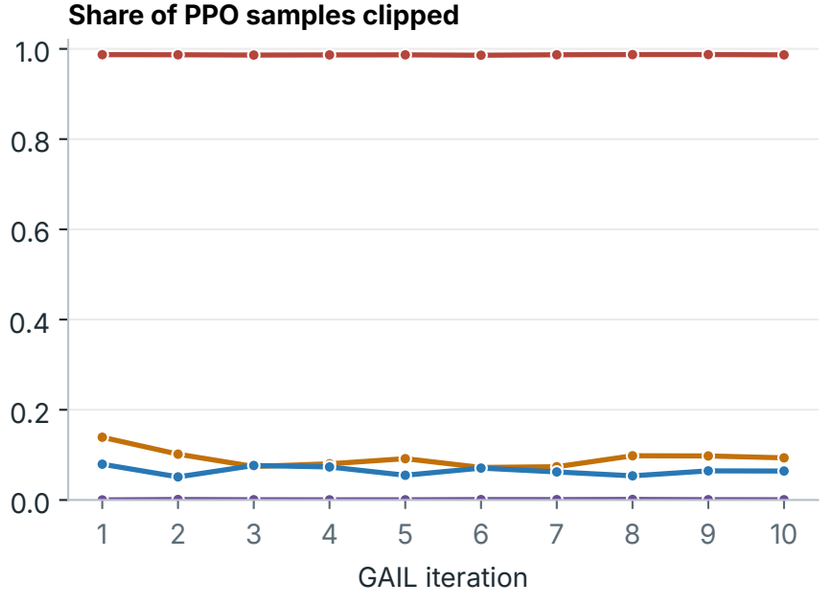
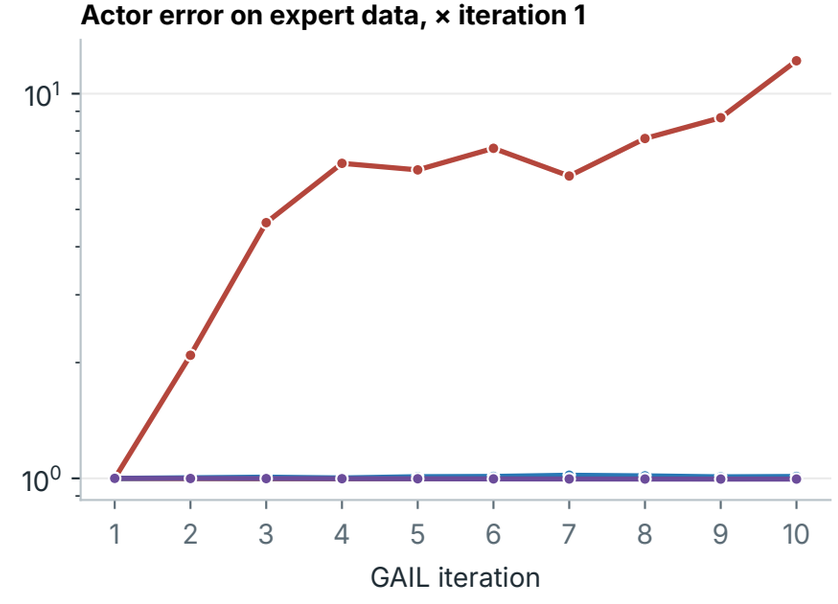
Early GAIL: the fixes stopped the collapse — and also stopped the actor from moving

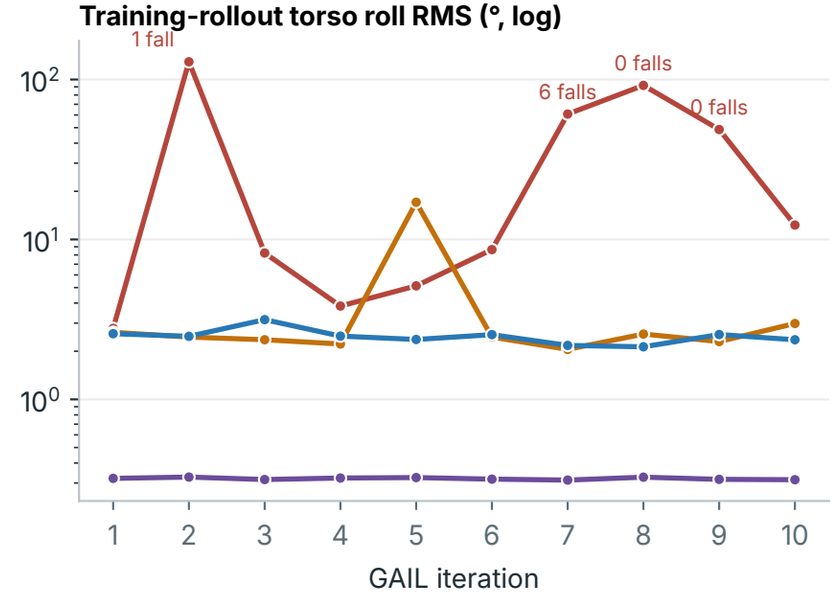












Before fixes: 02:29 backup of 5 Sep (minimax reward, no KL control, no BC anchor); KL shown is the logged approximate KL. Fixed runs: non-saturating log D reward, input normalisation, label smoothing, gradient penalty, discriminator early stop, 100× smaller actor LR, target-KL early stop + rollback, decaying BC anchor. 4,000-step rollouts; rollout N measures the actor before update N; rollouts use different target seeds, so they are diagnostics, not checkpoint rankings.
